

GDG-USAR Student Handbook

Sample source document for Task 3: AI-Powered Document Assistant

About This Document

This fictional handbook is provided for the AI-Powered Document Assistant project. It contains sample information about student support, club activities, event participation, and project submissions. It is not an official university policy document. Students should build their assistant so that answers are grounded in the text below and unsupported questions are clearly identified.

1. Student Support Desk

The Student Support Desk helps students find the correct university office for common academic and campus questions. The desk is open Monday to Friday, from 10:00 AM to 4:00 PM. It is closed on weekends and declared university holidays.

Students can contact the desk by email at support@example.edu or visit Room 204, Student Services Building. The desk can guide students on where to submit a request, but it does not approve academic extensions, fee refunds, or attendance exemptions.

For course registration questions, students should contact the academic office. For fee payment issues, they should contact the accounts office. For technical problems with the learning portal, they should contact the IT help desk.

2. GDG On Campus USAR

GDG On Campus USAR is a student community focused on learning, building projects, and sharing technical knowledge. Its activities may include workshops, study sessions, project showcases, and talks by invited speakers.

Students from any year or department may attend open community events, subject to venue capacity and event-specific registration requirements. Some activities may have limited seats. If registration is required, the event announcement will include the registration process and deadline.

The community currently organizes learning activities across four broad areas: Development, Machine Learning, Data Structures and Algorithms, and Cybersecurity. Non-technical activities may also be organized to support communication, collaboration, and community participation.

3. Workshop Participation

A typical technical workshop includes a short introduction, a guided hands-on activity, and time for questions. Participants should bring a laptop when the event announcement says that a laptop is required. If a workshop uses an online tool or repository, the organizer should share the relevant links before the session.

Participants are encouraged to install required software in advance. If installation is not possible, they should inform the organizers before the workshop. Organizers may provide an alternative such as a browser-based environment, but this is not guaranteed for every event.

Attendance at a workshop does not automatically provide a certificate. If a certificate is offered, its eligibility conditions will be stated in the event announcement.

4. Project Submissions

For community project activities, teams should submit their work using the platform and format specified in the task announcement. Unless a task says otherwise, a GitHub repository is recommended for code-based projects.

A project repository should include a README that explains the project goal, setup instructions, how to run the project, and any important limitations. Teams should also include a DECISIONS.md file describing at least one meaningful technical or design decision, including an alternative considered and the reason for the final choice.

If AI tools are used, teams should document their use in AI_USAGE.md. This file should briefly state which tools were used, what they were used for, and what parts of the work were reviewed or modified by the team. Students remain responsible for understanding and explaining their submissions.

A submission is considered complete only when all required files are present and the project can be reviewed using the provided instructions. A working demo is useful, but it does not replace the required source code and documentation.

5. Event Registration and Conduct

When an event requires registration, participants should use the registration link provided in the official event announcement. Registration does not guarantee entry if the event reaches its stated capacity; organizers should communicate any waitlist or entry process in advance.

Participants are expected to respect speakers, volunteers, and other attendees. Questions and constructive feedback are welcome. Harassment, disruption, or misuse of shared equipment may result in removal from the activity.

Photographs or recordings may be taken at community events. If an event involves recording, the announcement should inform participants. Anyone with a concern about being photographed or recorded should contact the event organizers.

6. Frequently Asked Questions

Can students from other departments attend open events?

Yes. Students from any year or department may attend open community events, subject to capacity and any event-specific registration requirements.

Does the Student Support Desk approve attendance exemptions?

No. The desk can guide students to the appropriate office but does not approve attendance exemptions.

Do all workshops provide certificates?

No. A certificate is provided only when the event announcement says one is offered and states the eligibility conditions.

What should a project README contain?

It should explain the project goal, setup instructions, how to run the project, and important limitations.

Where should students report learning-portal technical issues?

They should contact the IT help desk.

7. Information Not Specified Here

This sample handbook does not specify the date or venue of any upcoming event, the name of the current community lead, the exact certificate criteria for a particular workshop, or whether a specific student has completed registration. An assistant using this document should not invent answers to these questions. It should explain that the information is not available in the source document.
